1. Weekly Overview

This week, I completed the first four lectures of the MIT Introduction to Computer Science and Programming in Python course and attended two meetings on Friday: the weekly intern meeting and a GitHub sharing session.

2. Python Learning Progress

- Completed MIT Python Lectures 1-4.
- Reviewed core topics including Python syntax, variables, data types, conditionals, loops, string manipulation, basic search methods, functions, and variable scope.

3. Intern Meeting

During the intern meeting, I learned more about the expected work and future project requirements:

- Continue studying the MIT Python course by watching the lecture videos and completing the exercises.
- Make sure all major concepts and technical skills are understood before moving to project work.
- Create and maintain a GitHub account for internship work.
- Complete the projects included in the course materials and upload them to GitHub, beginning with small projects and progressing to medium and large projects.
- Include a complete README file for every project, covering the project overview, background, and program instructions.
- Add a clear header comment ("butterfly box") at the beginning of each program to explain the program goal and how to run it.

4. GitHub Sharing Session

During the GitHub session, Don Fox demonstrated the basic workflow for creating and managing a repository:

- Creating a new repository, including adding a description, choosing public or private access, adding a README file, and selecting a license.
- Cloning a remote repository to a local computer using git clone.
- Synchronizing remote updates with the local repository using git pull origin main.

- Verbus also emphasized the importance of consistently maintaining and updating GitHub as a professional portfolio.

5. Next Steps

- Continue with the next MIT Python lectures and complete the related exercises.
- Set up and organize the GitHub account and repositories.
- Begin with a small Python project and prepare the required README and program header comments.
